

USER DATA WEDGE MEDIA CERTIFICATION IN A DISC DRIVE DATA HANDLING SYSTEM

5

Abstract of the Disclosure

Method and apparatus for detecting defects in a magnetic medium of a data handling system. The magnetic medium includes a number of user data wedges each disposed between an adjacent pair of servo data wedges. A predetermined data sequence is written to the user data wedges, and subsequently read to generate

10 a readback signal. A sequence of discrete time sample values are generated from the readback signal. Defects in the medium are detected in relation to the magnitudes of the discrete time samples. A media scan controller outputs a first multi-bit information record having at least one bit composing the address of the user data wedge containing a defect, and a second multi-bit information record

15 having at least one bit composing an address of the defect within the user data wedge. No information is written to the buffer when no defects are identified.
